> Ichthus77:
>
> three body problem?

> ### 1. The Classical Physics & Math Problem
>
> At its core, the three-body problem is the question of **predicting the motion of three celestial bodies (like stars, planets, or moons) that are gravitationally interacting with each other.**
>
> - **The Two-Body Solution:** For two bodies (e.g., Earth and the Sun), Isaac Newton's laws of gravity provide a perfect, predictable solution: they orbit each other in stable elliptical paths.
> - **The Three-Body Complication:** When you add a third body (e.g., Earth, Sun, and Jupiter), the system becomes **chaotic**. There is no general, closed-form mathematical formula that can predict their exact motions infinitely into the future. Small changes in starting conditions lead to wildly different outcomes over time, making long-term prediction impossible.
>
> **Why is it important in science?**
> It's a fundamental example of **chaos theory** in physics. While we can simulate approximate solutions (like for the Earth-Moon-Sun system), we can never achieve perfect, long-term certainty. This problem affects space mission planning, astronomy, and our understanding of stellar systems.
>
> ---
>
> ### 2. The Science Fiction Novel & Series
>
> Cixin Liu's novel **"The Three-Body Problem"** (and its sequel trilogy *Remembrance of Earth's Past*) uses the physics problem as a central metaphor.
>
> **The Connection:**
>
> - In the book, an alien civilization lives in a **star system with three suns** (Alpha Centauri, in this case). The unpredictable gravitational interaction of these three stars—a literal three-body problem—creates a world with chaotic, extreme cycles of stable "Eras" and catastrophic "Chaotic Eras" that destroy civilization.
> - This existential threat drives the aliens (the Trisolarans) to seek a new home planet, leading them to Earth.
> - The unsolvable nature of the physics problem mirrors the themes of the story: **the fundamental unpredictability of the universe, the fragility of civilization, and the crisis that occurs when stable foundations break down.**
>
> **The "Three-Body Game" within the novel:** Human characters experience this alien world through a virtual reality game where players try to predict the orbits of the three suns to save a civilization, repeatedly failing—demonstrating the problem's insolvability.
>
> ---
>
> ### Key Takeaway:
>
> - **In science:** It's an unsolvable, chaotic dynamical system that limits our ability to predict complex gravitational interactions.
> - **In the novel:** It's a brilliant plot device and metaphor for a chaotic, unstable environment that forces an alien species into a desperate conflict with humanity.
>
> The novel's popularity has brilliantly revived interest in this centuries-old scientific dilemma, showing how a deep physics concept can frame a story about contact, survival, and cosmic sociology.

And?

Whats YOUR problem?

Ergo the will must be free to adapt to the unforeseeable in real time.

Chaos, I REPEAT, makes free-will necessary.

It offers an adaptive advantage…..

> Show me a thing, that is immutable, indivisible, static.
>
> You told me, now show me some-thing that is immutable, indivisible, static…..show me the god-particle, or is it just god?

That isn't how thing is defined. Thing is explicitly defined as:

> daniel j lavender:
>
> *Thing (n.): An existing, material or immaterial; a part of existence. That which is perceived or interacted with, at least in part, in some way.*

A diamond is a thing. A complete, single unit. I perceive it as such. I interact with it as such. This claim is not limited to myself as it applies to any other conscious being interacting with a diamond. The diamond can be picked up as an individual item and relocated to another area. A diamond has specific, identifiable qualities. All of these attributes indicate a thing.

> Silenus:

> > No. You have not explicitly mentioned destruction in this thread until now.
>
> Read back…interactivity means repulsion/attraction…..creating destroying…

I reviewed your statements. Your initial comments in this thread made no explicit reference to destruction or destroying. You first mentioned it today, roughly three hours ago.

You claimed energy is creating. You then claimed energy is destroying. You have no clear definition of energy. Your terms are vague and ill-defined. You have no systematic, structured philosophy. You are making things up as you go.

This is why you issue incoherent challenges like this:

> Silenus:
>
> ….show me an energy thing.

If all is energy then *any response* would be an example of it.

> Silenus:
>
> Define existence for me

Existence is defined as:

> daniel j lavender:
>
> *Existence (n.): Being; that which is perceived, at least in part; that which is interacted with, at least in part, in some way.*

The definition isn't mere labeling. It is operational. It establishes practical parameters for substantiation of being.

> Silenus:
>
> Tell me, after you give me your definition of existence, what is silence?

Silence is a condition or circumstance perceived.
